Type Package

Encoding UTF-8

Title Retrieve Flu Season Data from the United States Centers for Disease Control and Prevention ('CDC') 'FluView' Portal

Version 0.9.3

Date 2021-02-27

Maintainer Bob Rudis <bob@rud.is>

Description The 'U.S.' Centers for Disease Control and Prevention (CDC) maintain a portal <<https://gis.cdc.gov/grasp/fluview/fluportaldashboard.html>> for accessing state, regional and national influenza statistics as well as mortality surveillance data. The web interface makes it difficult and time-consuming to select and retrieve influenza data. Tools are provided to access the data provided by the portal's underlying 'API'.

age_group_distribution

Age Group Distribution of Influenza Positive Tests Reported by Public Health Laboratories

Description

Retrieves the age group distribution of influenza positive tests that are reported by public health laboratories by influenza virus type and subtype/lineage. Laboratory data from multiple seasons and different age groups is provided.

Usage

```
age_group_distribution(years = NULL)
```

Arguments

years	a vector of years to retrieve data for (i.e. 2014 for CDC flu season 2014-2015). CDC has data for this API going back to 1997. Default value (NULL) means retrieve all years. NOTE: if you happen to specify a 2-digit season value (i.e. 57 == 2017-2018) the function is smart enough to retrieve by season ID vs convert that to a year.

Examples

```
agd <- age_group_distribution(years=2015)
```

cdcfluvview	<i>Retrieve Flu Season Data from the United States Centers for Disease Control and Prevention ('CDC') 'FluView' Portal</i>
-------------	--

Description

The U.S. Centers for Disease Control (CDC) maintains a portal <https://gis.cdc.gov/grasp/fluview/fluportaldashboard.html> for accessing state, regional and national influenza statistics as well as Mortality Surveillance Data. The Flash interface makes it difficult and time-consuming to select and retrieve influenza data. This package provides functions to access the data provided by the portal's underlying API.

Author(s)

Bob Rudis (bob@rud.is)

cdc_basemap	<i>Retrieve CDC U.S. Basemaps</i>
-------------	-----------------------------------

Description

The CDC FluView application uses a composite basemaps of coverage areas within the United States that elides and scales Alaska, Hawaii, Puerto Rico & the Virgin Islands and some further provide elided and scaled breakouts for New York City and the District of Columbia.

This function retrieves the given shapefile, projects to EPSG:5069 and returns it as an sf (simple features) object.

Usage

```
cdc_basemap(  
  basemap = c("national", "hhs", "census", "states", "spread", "surv")  
)
```

Arguments

basemap select the CDC basemap. One of:

- "national": outline of the U.S. + AK, HI, PR + VI
- "hhs": outline of the U.S. + HHS Region Outlines + AK, HI, PR + VI
- "census": outline of the U.S. + Census Region Outlines + AK, HI, PR + VI
- "states": outline of the U.S. + State Outlines + AK, HI, PR + VI
- "spread": outline of the U.S. + State Outlines + AK, HI, PR + VI & Guam
- "surv": outline of the U.S. + State Outlines + AK, HI, PR + VI

Note

These are just the basemaps. You need to pair it with the data you wish to visualize.

Examples

```
## Not run:
plot(cdc_basemap("national"))

## End(Not run)
```

census_regions	<i>Census Region Table</i>
----------------	----------------------------

Description

This dataset contains the states belonging to the (presently) 4 U.S. Census regions in "long" format. It consists of a `data.frame` with the following columns:

- `region`: the official Census region name (e.g. "East")
- `state`: state belonging to the region

Usage

```
data(census_regions)
```

Format

A data frame with 51 rows and 2 variables

Note

Last updated 2015-08-09.

References

<https://www.cdc.gov/std/stats/>

geographic_spread	<i>State and Territorial Epidemiologists Reports of Geographic Spread of Influenza</i>
-------------------	--

Description

State and Territorial Epidemiologists Reports of Geographic Spread of Influenza

Usage

```
geographic_spread(years = NULL)
```

Arguments

years a vector of years to retrieve data for (i.e. 2014 for CDC flu season 2014-2015). CDC has data for this API going back to 2003 and up until the current, active flu season. Default value (NULL) means retrieve **all** years. NOTE: if you happen to specify a 2-digit season value (i.e. 57 == 2017-2018) the function is smart enough to retrieve by season ID vs convert that to a year.

Examples

```
## Not run:  
gs <- geographic_spread()  
  
## End(Not run)
```

get_flu_data	<i>Retrieves state, regional or national influenza statistics from the CDC (deprecated)</i>
--------------	---

Description

Uses the data source from the **CDC FluView** and provides flu reporting data as either a single data frame or a list of data frames (depending on whether either WHO NREVSS or ILINet (or both) is chosen).

Usage

```
get_flu_data(  
  region = "hhs",  
  sub_region = 1:10,  
  data_source = "ilinet",  
  years = as.numeric(format(Sys.Date(), "%Y"))  
)
```

Arguments

region	one of "hhs", "census", "national", "state"
sub_region	depends on the region_type. For "national", the sub_region should be NA. For "hhs", should be a vector between 1:10. For "census", should be a vector between 1:9. For "state", should be a vector of state/territory names or "all".
data_source	either of "who" (for WHO NREVSS) or "ilinet" or "all" (for both)
years	a vector of years to retrieve data for (i.e. 2014 for CDC flu season 2014-2015). Default value is the current year and all years values should be > 1997

Details

A lookup table between HHS regions and their member states/territories is provided in [hhs_regions](#).

Value

If only a single data_source is specified, then a single data.frame is returned, otherwise a named list with each data.frame is returned.

Note

There is often a noticeable delay when making the API request to the CDC. This is not due to a large download size, but the time it takes for their servers to crunch the data. Wrap the function call in `httr::with_verbose` if you would like to see what's going on.

get_hosp_data	<i>Retrieves influenza hospitalization statistics from the CDC (depre- cated)</i>
---------------	---

Description

Uses the data source from the [CDC FluView](#) and provides influenza hospitalization reporting data as a data frame.

Usage

```
get_hosp_data(
  area = "flusurvnet",
  age_group = "overall",
  years = as.numeric(format(Sys.Date(), "%Y")) - 1
)
```

Arguments

area	one of "flusurvnet", "eip", "ihsp", or two digit state abbreviation for an individual site. Exceptions are New York - Albany ("nya") and New York - Rochester ("nyr")
age_group	a vector of age groups to pull data for. Possible values are: "overall", "0-4y", "5-17y", "18-49y", "50-64y", "65+y".
years	a vector of years to retrieve data for (i.e. 2014 for CDC flu season 2014-2015). Default value is the current year and all years values should be ≥ 2009

Value

A single data.frame.

Note

There is often a noticeable delay when making the API request to the CDC. This is not due to a large download size, but the time it takes for their servers to crunch the data. Wrap the function call in `httr::with_verbose` if you would like to see what's going on.

Examples

```
## Not run:
# All of FluSurv-NET, 50-64 years old, 2010/11-2014/15 flu seasons
hosp <- get_hosp_data("flusurvnet", "50-64y", years=2010:2014)

## End(Not run)
```

get_state_data	<i>Retrieves state/territory-level influenza statistics from the CDC (deprecated)</i>
----------------	---

Description

Uses the data source from the CDC' State-levelFluView <https://gis.cdc.gov/grasp/fluview/main.html> and provides state flu reporting data as a single data frame.

This function provides similar data to [get_weekly_flu_report](#) but provides more metadata about the reporting sources and has access to more historical information.

Usage

```
get_state_data(years = as.numeric(format(Sys.Date(), "%Y")))
```

Arguments

years	a vector of years to retrieve data for (i.e. 2014 for CDC flu season 2014-2015). Default value is the current year and all years values should be ≥ 2008
-------	---

Value

A data.frame of state-level data for the specified seasons (also classed as cdcstatedata)

Note

There is often a noticeable delay when making the API request to the CDC. This is not due to a large download size, but the time it takes for their servers to crunch the data. Wrap the function call in `httr::with_verbose` if you would like to see what's going on.

Examples

```
state_data <- get_state_data(2014)
## Not run:
gsd <- get_state_data(c(2013, 2014))
gsd <- get_state_data(2010:2014)

## End(Not run)
```

`get_weekly_flu_report` *Retrieves (high-level) weekly (XML) influenza surveillance report from the CDC*

Description

The CDC publishes a **weekly influenza report** detailing high-level flu activity per-state. They also publish a data file (see References) of historical report readings. This function reads that XML file and produces a long `data.frame` with the historical surveillance readings.

This function provides similar data to `get_state_data` but without the reporting source metadata and a limit on the historical flu information.

Usage

```
get_weekly_flu_report()
```

Value

`tbl_df` (also classed with `cdcweeklyreport`) with six columns: `year`, `week_number`, `state`, `color`, `label`, `subtitle`

References

<https://www.cdc.gov/flu/weekly/flureport.xml>

Examples

```
## Not run:
wfr <- get_weekly_flu_report()

## End(Not run)
```

`hhs_regions`*HHS Region Table*

Description

This dataset contains the names, numbers, regional offices for-, and states/territories belonging to the (presently) 10 HHS U.S. regions in "long" format. It consists of a `data.frame` with the following columns:

- `region`: the official HHS region name (e.g. "Region 1")
- `region_number`: the associated region number
- `regional_office`: the HHS regional office for the entire region
- `state_or_territory`: state or territory belonging to the region

Usage

```
data(hhs_regions)
```

Format

A data frame with 59 rows and 4 variables

Note

Last updated 2015-08-09.

References

<https://www.hhs.gov/about/agencies/iea/regional-offices/index.html>

`hospitalizations`*Laboratory-Confirmed Influenza Hospitalizations*

Description

Laboratory-Confirmed Influenza Hospitalizations

Usage

```
hospitalizations(  
  surveillance_area = c("flusurv", "eip", "ihsp"),  
  region = "all",  
  years = NULL  
)
```

Arguments

surveillance_area	one of "flusurv", "eip", or "ihsp"
region	Using "all" mimics selecting "Entire Network" from the CDC FluView application drop down. Individual regions for each surveillance area can also be selected. Use <code>surveillance_areas()</code> to see a list of valid sub-regions for each surveillance area.
years	a vector of years to retrieve data for (i.e. 2014 for CDC flu season 2014-2015). CDC has data for this API going back to 2009 and up until the <i>previous</i> flu season. Default value (NULL) means retrieve all years. NOTE: if you happen to specify a 2-digit season value (i.e. 56 == 2016-2017) the function is smart enough to retrieve by season ID vs convert that to a year.

References

- [Hospital Portal](#)

Examples

```
hosp_fs <- hospitalizations("flusurv", years=2015)
## Not run:
hosp_eip <- hospitalizations("eip")
hosp_ihsp <- hospitalizations("ihsp")

## End(Not run)
```

ilinet

Retrieve ILINet Surveillance Data

Description

The CDC FluView Portal provides in-season and past seasons' national, regional, and state-level outpatient illness and viral surveillance data from both ILINet (Influenza-like Illness Surveillance Network) and WHO/NREVSS (National Respiratory and Enteric Virus Surveillance System).

Usage

```
ilinet(region = c("national", "hhs", "census", "state"), years = NULL)
```

Arguments

region	one of "national", "hhs", "census", or "state"
years	a vector of years to retrieve data for (i.e. 2014 for CDC flu season 2014-2015). CDC has data for this API going back to 1997. Default value (NULL) means retrieve all years. NOTE: if you happen to specify a 2-digit season value (i.e. 57 == 2017-2018) the function is smart enough to retrieve by season ID vs convert that to a year.

Details

This function retrieves current and historical ILINet surveillance data for the identified region.

References

- [CDC FluView Portal](#)
- [ILINet Portal](#) (Login required)
- [WHO/NREVSS](#)

Examples

```
national_ili <- ilinet("national", years = 2017)
## Not run:
hhs_ili <- ilinet("hhs")
census_ili <- ilinet("census")
state_ili <- ilinet("state")

all_ili <- suppressWarnings(
  suppressMessages(purrr::map_df(c("national", "hhs", "census", "state"), ilinet))
)

## End(Not run)
```

ili_weekly_activity_indicators

Retrieve weekly state-level ILI indicators per-state for a given season

Description

Retrieve weekly state-level ILI indicators per-state for a given season

Usage

```
ili_weekly_activity_indicators(years = NULL)
```

Arguments

years a vector of years to retrieve data for (i.e. 2014 for CDC flu season 2014-2015). CDC has data for this API going back to 2008 and up until the current, active flu season. Default value (NULL) means retrieve **all** years. NOTE: if you happen to specify a 2-digit season value (i.e. 57 == 2017-2018) the function is smart enough to retrieve by season ID vs convert that to a year.

Note

These statistics use the proportion of outpatient visits to healthcare providers for influenza-like illness to measure the ILI activity level within a state. They do not, however, measure the extent of geographic spread of flu within a state. Therefore, outbreaks occurring in a single city could cause the state to display high activity levels.

Data collected in ILINet may disproportionately represent certain populations within a state, and therefore may not accurately depict the full picture of influenza activity for the whole state.

All summary statistics are based on either data collected in ILINet, or reports from state and territorial epidemiologists. Differences in the summary data presented by CDC and state health departments likely represent differing levels of data completeness with data presented by the state likely being the more complete.

- [ILI Activity Indicator Map Portal](#)

Examples

```
## Not run:
iwai <- ili_weekly_activity_indicators(2016)

## End(Not run)
```

mmwrid_map

MMWR ID to Calendar Mappings

Description

The CDC uses a unique "Morbidity and Mortality Weekly Report" identifier for each week that starts at 1 (Ref: < <https://www.cdc.gov/mmwr/preview/mmwrhtml/su6004a9.htm>>). This data frame consists of 4 columns:

- `wk_start`: Start date (Sunday) for the week (Date)
- `wk_end`: End date (Saturday) for the week (Date)
- `year_wk_num`: The week of the calendar year
- `mmwrid`: The unique MMWR identifier These can be "left-joined" to data provided from the CDC to perform MMWR identifier to date mappings.

Format

A data frame with 4,592 rows and 4 columns

mmwr_week	<i>Convert a Date to an MMWR day+week+year</i>
-----------	--

Description

This is a reformat and re-export of a function in the MMWRweek package. It provides a snake case version of its counterpart, produces a tibble

Usage

```
mmwr_week(x)
```

Arguments

x a vector of Date objects or a character vector in YYYY-mm-dd format.

Value

data frame (tibble)

Examples

```
mwk <- mmwr_week(Sys.Date())
```

mmwr_weekday	<i>Convert a Date to an MMWR weekday</i>
--------------	--

Description

This is a reformat and re-export of a function in the MMWRweek package. It provides a snake case version of its counterpart, produces a factor of weekday names (Sunday-Saturday).

Usage

```
mmwr_weekday(x, abbr = FALSE)
```

Arguments

x a vector of Date objects or a character vector in YYYY-mm-dd format.
abbr (logical) if TRUE, return abbreviated weekday names, otherwise full weekday names (see Note).

Value

ordered factor

Note

Weekday names are explicitly mapped to "Sunday-Saturday" or "Sun-Sat" and do not change with your locale.

Examples

```
mwday <- mmwr_weekday(Sys.Date())
```

mmwr_week_to_date	<i>Convert an MMWR year+week or year+week+day to a Date object</i>
-------------------	--

Description

This is a reformat and re-export of a function in the MMWRweek package. It provides a snake case version of its counterpart and produces a vector of Date objects that corresponds to the input MMWR year+week or year+week+day vectors. This also adds some parameter checking and cleanup to avoid exceptions.

Usage

```
mmwr_week_to_date(year, week, day = NULL)
```

Arguments

year, week, day Year, week and month vectors. All must be the same length unless day is NULL.

Value

vector of Date objects

Examples

```
mwd <- mmwr_week_to_date(2016,10,3)
```

Description

The National Center for Health Statistics (NCHS) collects and disseminates the Nation's official vital statistics. NCHS collects death certificate data from state vital statistics offices for virtually all deaths occurring in the United States. Pneumonia and influenza (P&I) deaths are identified based on ICD-10 multiple cause of death codes.

NCHS Mortality Surveillance System data are presented by the week the death occurred at the national, state, and HHS Region levels. Data on the percentage of deaths due to P&I on a national level are released two weeks after the week of death to allow for collection of enough data to produce a stable percentage. States and HHS regions with less than 20% of the expected total deaths (average number of total deaths reported by week during 2008-2012) will be marked as insufficient data. Collection of complete data is not expected at the time of initial report, and a reliable percentage of deaths due to P&I is not anticipated at the U.S. Department of Health and Human Services region or state level within this two week period. The data for earlier weeks are continually revised and the proportion of deaths due to P&I may increase or decrease as new and updated death certificate data are received by NCHS.

The seasonal baseline of P&I deaths is calculated using a periodic regression model that incorporates a robust regression procedure applied to data from the previous five years. An increase of 1.645 standard deviations above the seasonal baseline of P&I deaths is considered the "epidemic threshold," i.e., the point at which the observed proportion of deaths attributed to pneumonia or influenza was significantly higher than would be expected at that time of the year in the absence of substantial influenza-related mortality. Baselines and thresholds are calculated at the national and regional level and by age group.

Usage

```
pi_mortality(coverage_area = c("national", "state", "region"), years = NULL)
```

Arguments

coverage_area	coverage area for data (national, state or region)
years	a vector of years to retrieve data for (i.e. 2014 for CDC flu season 2014-2015). CDC has data for this API going back to 2009 and up until the current, active flu season. Default value (NULL) means retrieve all years. NOTE: if you happen to specify a 2-digit season value (i.e. 57 == 2017-2018) the function is smart enough to retrieve by season ID vs convert that to a year.

Note

Queries for "state" and "region" are not necessarily as "instantaneous" as other API endpoints and can near or over 30s retrieval delays.

For consistency with `ilinet` columns indicating the week now contain 'week' instead of the previously abbreviation 'wk'.

References

- [Pneumonia and Influenza Mortality Surveillance Portal](#)

Examples

```
## Not run:
ndf <- pi_mortality()
sdf <- pi_mortality("state")
rdf <- pi_mortality("region")

## End(Not run)
```

`state_data_providers` *Retrieve metadata about U.S. State CDC Provider Data*

Description

Retrieve metadata about U.S. State CDC Provider Data

Usage

```
state_data_providers()
```

Examples

```
sdp <- state_data_providers()
```

`surveillance_areas` *Retrieve a list of valid sub-regions for each surveillance area.*

Description

Retrieve a list of valid sub-regions for each surveillance area.

Usage

```
surveillance_areas()
```

Examples

```
sa <- surveillance_areas()
```

 who_nrevss

 Retrieve WHO/NREVSS Surveillance Data

Description

The CDC FluView Portal provides in-season and past seasons' national, regional, and state-level outpatient illness and viral surveillance data from both ILINet (Influenza-like Illness Surveillance Network) and WHO/NREVSS (National Respiratory and Enteric Virus Surveillance System).

Usage

```
who_nrevss(region = c("national", "hhs", "census", "state"), years = NULL)
```

Arguments

region	one of "national", "hhs", "census", or "state"
years	a vector of years to retrieve data for (i.e. 2014 for CDC flu season 2014-2015). CDC has data for this API going back to 1997. Default value (NULL) means retrieve all years. NOTE: if you happen to specify a 2-digit season value (i.e. 57 == 2017-2018) the function is smart enough to retrieve by season ID vs convert that to a year.

Details

This function retrieves current and historical WHO/NREVSS surveillance data for the identified region.

Value

list of data frames identified by

- combined_prior_to_2015_16
- public_health_labs
- clinical_labs

Note

HHS, Census and State data retrieval is not as "instantaneous" as their ILINet counterparts.

Also, beginning for the 2015-16 season, reports from public health and clinical laboratories are presented separately in the weekly influenza update. This is the reason why a list of data frames is returned.

ALSO The new CDC API seems to be missing some public health lab data fields.
