plot3Drgl-package  

*Functions to plot multi-dimensional data using rgl.*

**Description**

Package plot3Drgl provides an interface from package plot3D to package rgl. 
It will plot most (but not all) features from plots generated with plot3D, except for the color keys and polygons. 
It also includes rgl implementations of 2-D functions (arrows, points, contours, images), which can be zoomed, moved, and sections selected.

**Author(s)**

Karline Soetaert

**See Also**

Functions from R-package plot3D.
Functions from R-package rgl.

- For 3-D graphs:
  - plotrgl the main function that translates plot3D graphs to rgl.
- For 2-D graphs:
  - arrows2Drgl creates 2-D arrow plots.
  - scatter2Drgl for point and line plots.
  - image2Drgl, contour2Drgl an rgl implementation of the image and contour functions.

Apart from the usual zooming, it is also possible to move the figure in the rgl window (based on an example in the rgl package).
Rectangular areas can be selected from rgl plots, using cutrgl while uncutrgl will restore the original plot.

**cutrgl**

*Cutting a rectangular region from an rgl plot.*

**Description**

cutrgl zooms in on a selected region of the plot. It overwrites the current plot. Selection is done by dragging over the plot, with the left mousekey clicked.
croprgl zooms in on a region of the plot defined by the axes limits. It overwrites the current plot.
uncutrgl and uncroprgl restore the original plot, but keep the current orientation.
cutrgl

Usage

cutrgl (...)  
croprgl (xlim = NULL, ylim = NULL, zlim = NULL, ...)  
uncutrgl (...)  
uncroprgl(...)

Arguments

xlim, ylim, zlim

The limits of the plot.

...  

Any argument that can be passed to the function plotrgl, e.g argument lighting, or to the rgl functions par3d, open3d or material3d. Exceptions are new and add (which are always FALSE).

Value

Returns the updated plotting list. See plotdev.

Note

Both functions will not work when another active rgl window has been opened. In that case, cutrgl will freeze R, and the escape key should be used.

Author(s)

Karline Soetaert <karline.soetaert@nioz.nl>

See Also

plotrgl,  
material3d, par3d for rgl arguments that can be passed to the function.

Examples

## Not run:
ribbon3D(z = volcano, zlim= c(-100, 200), image = TRUE, plot = FALSE)
plotrgl(new = TRUE) # new window

cutrgl() # select region with left mouse
cutrgl() # second selection
uncutrgl() # original restored

## End(Not run)
image2Drgl

2-D image, contour, scatterplots, segments and arrows in rgl.

Description

image2Drgl plots an image in rgl.
contour2Drgl creates a contourplot in rgl.
scatter2Drgl creates a scatterplot (lineplot, points, ...) in rgl.
arrows2Drgl and segments3D plot arrows and segments in rgl.
text2Drgl plot labels in rgl.

These functions were implemented for their sideeffect that rgl plots can be zoomed, translocated, rectangular selections taken.

Usage

```r
image2Drgl (z, x = seq(0, 1, length.out = nrow(z)),
          y = seq(0, 1, length.out = ncol(z)), ...,
          col = jet.col(100), NAcoul = "white", border = NA,
          contour = FALSE, smooth = FALSE,
          clim = NULL, inttype = 1, dz = 0, add = FALSE)

contour2Drgl (z, x = seq(0, 1, length.out = nrow(z)),
             y = seq(0, 1, length.out = ncol(z)), ...,
             col = NULL, clim = NULL, dz = 0.1, add = FALSE)

scatter2Drgl (x, y, colvar = NULL, ...
              col = NULL, NAcoul = "white",
              clim = NULL, CI = NULL, dz = 0.1, add = FALSE)

text2Drgl (x, y, labels, colvar = NULL, ...
           col = NULL, NAcoul = "white",
           clim = NULL, CI = NULL, dz = 0.1, add = FALSE)

arrows2Drgl (x0, y0, x1, y1, colvar = NULL, ...
             col = NULL, NAcoul = "white", clim = NULL,
             type = "simple", dz = 0.1, add = FALSE)

segments2Drgl (x0, y0, x1, y1, colvar = NULL, ...
               col = NULL, NAcoul = "white", clim = NULL,
               type = "simple", dz = 0.1, add = FALSE)
```

Arguments

x, y

Vectors with the x- and y- values.
The variable used for coloring the image plot, or containing the values to be plotted for the contour plot.

coordinates of points from which to draw the arrows.

coordinates of points to which to draw the arrows. At least one must be supplied.

The variable used for coloring the scatter plot or the arrows. If NULL, then col will be used as such.

The text to be written. A vector of length equal to length of x, y.

Color palette to be used for the z or colvar variable. If colvar is NULL, then the colors are used as such.

Color to be used for NA values; default is “white”.

The color of the lines drawn around the surface facets. The default, NA, will disable the drawing of borders.

If TRUE, then a contour plot will be added to the image plot. Also allowed is to pass a list with arguments for the contour2D function.

Logical, specifying whether Gouraud shading (smooth) or flat shading should be used. (if TRUE then function cutrgl will not work).

Only if colvar is specified, the range of the color variable used. Values of colvar that extend the range will be put to NA.

The interpolation type to create the polygons, either interpolating the z (inttype = 1) or the x, y values (inttype = 2) - see persp3D.

A list with parameters and values for the confidence intervals or NULL. If a list it should contain at least the item x or y. Other parameters should be one of (with defaults): alen = 0.01, lty = par("lty"), lwd = par("lwd"), col = NULL, to set the length of the arrow head, the line type and width, and the color. If col is NULL, then the colors of the scatter points are used.

The type of the arrow head, one of "simple" (the default, which uses R-function arrows) or "triangle".

The 'layer depth'. The z-position is defined as 1 + dz.

Logical. If TRUE, then the image, contour or points will be added to the current plot. If FALSE a new plot is started.

... additional arguments passed to the plotting methods. The following persp arguments can be specified: xlim, ylim, zlim, xlab, ylab, zlab, main, sub, r, d, scale, expand. In addition, the perspbox arguments col.axis, col.panel, lwd.panel, col.grid, lwd.grid can also be given a value.

Also the arguments lty, lwd can be specified.

The arguments after ... must be matched exactly.

Details

The first step in 2D rgl plotting consists in calling a 3-D function from package plot3D with argument plot set to FALSE.

image2Drgl and contour2Drgl call the image3D and contour3D functions of R-package plot3D, with colvar equal to z. Functions scatter2Drgl and arrows2Drgl call scatter3D and arrows3D.
The z value argument to the 3-D functions is set equal to 1 + dz; For contour3D, scatter3D and arrows3D, it is by default equal to 1.1, while for image3D it is 1. This way, contours, points, segments and arrows will be drawn on top of the image.

The next step is to create a 3-D rgl plot, by calling plotrgl. After that, the viewing arguments are set equal to view3d(phi = 0, fov = 0), i.e. the plot is viewed at from the top.

The actions of the mouse on the plots is to zoom (left, middle), and to move it (right key).

See Also

image3D, contour3D, scatter3D, segments3D, text3D and arrows3D on which the functions are based.

image2D, contour2D, scatter2D, segments2D, text2D, arrows2D for plot3D’s functions, to plot in ordinary R graphics.

cutrgl for cutting a rectangular region from the 2D plot.

Examples

```r
## image and points
image2Drgl(x = volcano, contour = TRUE, main = "volcano")
scatter2Drgl(x = seq(0, 1, by = 0.2), y = seq(0, 1, by = 0.2), cex = 3, add = TRUE)

## Not run:
cutrgl()
# select a rectangle
uncutrgl()

## End(Not run)

## scatter points, and lines
scatter2Drgl(cars[,1], cars[,2], xlab = "speed", ylab = "dist")

## Not run:
cutrgl()

## End(Not run)
lc <- lowess(cars)
scatter2Drgl(lc$x, lc$y, type = "l", add = TRUE, lwd = 4)

## Not run:
cutrgl()
uncutrgl()
```
### End(Not run)

### confidence intervals

```
x <- sort(rnorm(10))
y <- runif(10)
cv <- sqrt(x^2 + y^2)

CI <- list(lwd = 2)
CI$x <- matrix(nrow = length(x), data = c(rep(0.125, 2*length(x))))
scatter2D(x, y, colvar = cv, pch = 16, cex = 2, CI = CI)

scatter2Drgl(x, y, colvar = cv, cex = 2, CI = CI)
```

```
### arrows
### arrows2Drgl(x0 = 100*runif(30), y0 = runif(30), x1 = 100*runif(30),
y1 = runif(30), length = 0.1*runif(30), col = 1:30, angle = 15:45,
type = c("simple", "triangle"), lwd = 2)

x0 <- 1:30
x1 <- 2:31
arrows2Drgl(x0 = x0, y0 = sin(x0), x1 = x1, y1 = sin(x1),
colvar = x1, lwd = 2)
```

---

**persp3Drgl**

3-D plotting functions using rgl.

### Description

Functions persp3Drgl, ribbon3Drgl, hist3Drgl produce perspective plots using rgl; they are similar to functions persp3D, ribbon3D, hist3D from package plot3D.

Functions scatter3Drgl, points3Drgl, lines3D, segments3Drgl produce scatter plots and line plots using rgl; they are similar to functions scatter3D, points3D, lines3D, segments3D from package plot3D.

Functions slice3Drgl, points3Drgl, isosurf3Drgl, voxel3Drgl can visualise volumetric (3D) data using rgl; they are similar to functions slice3D, slicecont3D, isosurf3D, voxel3D from package plot3D.

Functions surf3Drgl, spheresurf3Drgl produce surface plots using rgl; they are similar to functions surf3D, spheresurf3D from package plot3D.

Functions box3Drgl, border3Drgl, rect3Drgl, text3Drgl produce boxes, rectangles, texts to 3D plots using rgl; they are similar to functions box3D, border3D, rect3D, text3Drgl from package plot3D.

These functions were implemented for their sideeffect that rgl plots can be zoomed, translocated, rectangular selections taken.
Usage

cutrgl for cutting a rectangular region from the rgl plot.
Examples

```r
### perspective plots
persp3Drgl(z = volcano, contour = list(side = "zmax"))

# ribbon, in x--direction
v <- volcano[seq(1, nrow(volcano), by = 5),
             seq(1, ncol(volcano), by = 5)] # lower resolution
ribbon3Drgl(z = V, ticktype = "detailed")
hist3Drgl(z = V, col = "grey", border = "black", lighting = TRUE)

### scatter points
with(quakes, scatter3Drgl(x = long, y = lat, z = -depth,
colvar = mag, cex = 3))

plotdev() # plots same on oridinary device...

### 3D surface

M <- mesh(seq(0, 2*pi, length.out = 50),
          seq(0, 2*pi, length.out = 50))
u <- M$x ; v <- M$y

x <- sin(u)
y <- sin(v)
z <- sin(u + v)

# alpha makes colors transparent
surf3Drgl(x, y, z, colvar = z, border = "black", smooth = TRUE,
          alpha = 0.2)

### volumetric data

x <- y <- z <- seq(-4, 4, by = 0.2)
M <- mesh(x, y, z)

R <- with(M, sqrt(x^2 + y^2 + z^2))
p <- sin(z*R)/(R+1e-3)
```
plotrgl(x, y, z, colvar = p, col = jet.col(alpha = 0.5),
xs = 0, ys = c(-4, 0, 4), zs = NULL, d = 2)

plotrgl

Plot 3D graphs in rgl window.

Description
plotrgl plots objects created with functions from package plot3d in an rgl window.

Usage
plotrgl (lighting = FALSE, new = TRUE, add = FALSE, smooth = FALSE, ...)  

Arguments

lighting Logical, when TRUE will add light. Default is with lighting toggled off; this is similar to shading  
new Logical, when TRUE will open a new window. When FALSE will start a new plot in the same window. Is overruled (to FALSE) if add is TRUE.  
add Logical, when TRUE will add to the current plot.  
smooth Logical, specifying whether Gouraud shading (smooth) or flat shading should be used. See material3d from R-package rgl. (note: if TRUE then cutrgl will not work). This only affects images.  
... Any argument to the rgl functions, e.g arguments from par3d, open3d or material3d.

Note
Arrows are best reproduced with argument type from the arrows3D function (package plot3d) set equal to "cone", although this does not always work well (there is probably a flaw in how it is implemented). Another option is to use type = "triangle", which simply maps the arrows on the xy-plane, ignoring the z-axis. In this case, only a view from above (phi = 0) will produce symmetric arrowheads (when scale = TRUE and expand = 1).

The translation of scatter3D ignores the pch argument but displays all symbols as squares (if pch = ".") or as filled circles.

The color key is not (cannot be) plotted in rgl.

In rgl, both lty and lwd have to be one number. For lwd, this has been overruled, i.e. line widths can be a vector. It is still not possible to use different line types in one type of object.

The actions of the mouse on the plots is to rotate (left), to move (middle), and to zoom it (right).
