Package 'mlflow'

March 14, 2024

Title Interface to 'MLflow' Version 2.11.1 Maintainer Matei Zaharia <matei@databricks.com> **Description** R interface to 'MLflow', open source platform for the complete machine learning life cycle, see https://mlflow.org/>. This package supports installing 'MLflow', tracking experiments, creating and running projects, and saving and serving models. License Apache License 2.0 URL https://github.com/mlflow/mlflow BugReports https://github.com/mlflow/mlflow/issues **Depends** R (>= 3.3.0) **Imports** base64enc, forge, fs, git2r, glue, httpuv, httr, ini, jsonlite, openssl, processx, purrr, rlang (>= 0.2.0), swagger, tibble (>= 2.0.0), withr, yaml, zeallot Suggests carrier, covr, h2o, keras, lintr, sparklyr, stringi, testthat (>= 2.0.0), reticulate, xgboost **Encoding UTF-8** RoxygenNote 7.1.2 Collate 'cli.R' 'databricks-utils.R' 'globals.R' 'imports.R' 'logging.R' 'mlflow-package.R' 'model-crate.R' 'model-python.R' 'model.R' 'model-utils.R' 'model-h2o.R' 'model-keras.R' 'model-registry.R' 'model-serve.R' 'model-swagger.R' 'model-xgboost.R' 'project-param.R' 'project-run.R' 'project-source.R' 'python.R' 'tracking-client.R' 'tracking-experiments.R' 'tracking-observer.R' 'tracking-globals.R' 'tracking-rest.R' 'tracking-runs.R' 'tracking-server.R' 'tracking-ui.R' 'tracking-utils.R'

build_context_tags_from_databricks_job_info

Get information from a Databricks job execution context

Description

Index

Parses the data from a job execution context when running on Databricks in a non-interactive mode. This function extracts relevant data that MLflow needs in order to properly utilize the MLflow APIs from this context.

Usage

build_context_tags_from_databricks_job_info(job_info)

Arguments

job_info The job-related metadata from a running Databricks job

Value

A list of tags to be set by the run context when creating MLflow runs in the current Databricks Job environment

4 mlflow_client

 $build_context_tags_from_databricks_notebook_info$ $Get \ information \ from \ Databricks \ Notebook \ environment$

Description

Retrieves the notebook id, path, url, name, version, and type from the Databricks Notebook execution environment and sets them to a list to be used for setting the configured environment for executing an MLflow run in R from Databricks.

Usage

build_context_tags_from_databricks_notebook_info(notebook_info)

Arguments

Value

A list of tags to be set by the run context when creating MLflow runs in the current Databricks Notebook environment

mlflow_client

Initialize an MLflow Client

Description

Initializes and returns an MLflow client that communicates with the tracking server or store at the specified URI.

Usage

```
mlflow_client(tracking_uri = NULL)
```

Arguments

tracking_uri The tracking URI. If not provided, defaults to the service set by 'mlflow_set_tracking_uri()'.

```
mlflow_create_experiment
```

Create Experiment

Description

Creates an MLflow experiment and returns its id.

Usage

```
mlflow_create_experiment(
  name,
  artifact_location = NULL,
  client = NULL,
  tags = NULL
)
```

Arguments

name The name of the experiment to create.

artifact_location

Location where all artifacts for this experiment are stored. If not provided, the

remote server will select an appropriate default.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

tags Experiment tags to set on the experiment upon experiment creation.

```
mlflow_create_model_version
```

Create a model version

Description

Create a model version

```
mlflow_create_model_version(
  name,
  source,
  run_id = NULL,
  tags = NULL,
```

```
run_link = NULL,
description = NULL,
client = NULL
)
```

Arguments

name Register model under this name.

source URI indicating the location of the model artifacts.

run_id MLflow run ID for correlation, if 'source' was generated by an experiment run

in MLflow Tracking.

tags Additional metadata.

run_link MLflow run link - This is the exact link of the run that generated this model

version.

description Description for model version.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_create_registered_model

Create registered model

Description

Creates a new registered model in the model registry

Usage

```
mlflow_create_registered_model(
  name,
  tags = NULL,
  description = NULL,
  client = NULL
)
```

Arguments

name The name of the model to create.

tags Additional metadata for the registered model (Optional).

description Description for the registered model (Optional).

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

mlflow_delete_experiment

Delete Experiment

Description

Marks an experiment and associated runs, params, metrics, etc. for deletion. If the experiment uses FileStore, artifacts associated with experiment are also deleted.

Usage

```
mlflow_delete_experiment(experiment_id, client = NULL)
```

Arguments

experiment_id ID of the associated experiment. This field is required.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_delete_model_version

Delete a model version

Description

Delete a model version

Usage

```
mlflow_delete_model_version(name, version, client = NULL)
```

Arguments

name Name of the registered model.

version Model version number.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

8 mlflow_delete_run

mlflow_delete_registered_model

Delete registered model

Description

Deletes an existing registered model by name

Usage

```
mlflow_delete_registered_model(name, client = NULL)
```

Arguments

name The name of the model to delete

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_delete_run

Delete a Run

Description

Deletes the run with the specified ID.

Usage

```
mlflow_delete_run(run_id, client = NULL)
```

Arguments

run_id Run ID.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

mlflow_delete_tag 9

mlflow	_delete_t	tag	Delete Tag
111 T T OW_		Lub	Duicic Ius

Description

Deletes a tag on a run. This is irreversible. Tags are run metadata that can be updated during a run and after a run completes.

Usage

```
mlflow_delete_tag(key, run_id = NULL, client = NULL)
```

Arguments

key Name of the tag. Maximum size is 255 bytes. This field is required.

run_id Run ID.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_download_artifacts

Download Artifacts

Description

Download an artifact file or directory from a run to a local directory if applicable, and return a local path for it.

Usage

```
mlflow_download_artifacts(path, run_id = NULL, client = NULL)
```

Arguments

path Relative source path to the desired artifact.

run_id Run ID

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

mlflow_end_run

End a Run

Description

Terminates a run. Attempts to end the current active run if 'run_id' is not specified.

Usage

```
mlflow_end_run(
   status = c("FINISHED", "FAILED", "KILLED"),
   end_time = NULL,
   run_id = NULL,
   client = NULL
)
```

Arguments

status Updated status of the run. Defaults to 'FINISHED'. Can also be set to "FAILED"

or "KILLED".

end_time Unix timestamp of when the run ended in milliseconds.

run_id Run ID.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_get_experiment Get Experiment

Description

Gets metadata for an experiment and a list of runs for the experiment. Attempts to obtain the active experiment if both 'experiment_id' and 'name' are unspecified.

```
mlflow_get_experiment(experiment_id = NULL, name = NULL, client = NULL)
```

Arguments

experiment_id ID of the experiment.

name The experiment name. Only one of 'name' or 'experiment_id' should be speci-

fied.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_get_latest_versions

Get latest model versions

Description

Retrieves a list of the latest model versions for a given model.

Usage

```
mlflow_get_latest_versions(name, stages = list(), client = NULL)
```

Arguments

name Name of the model.

stages A list of desired stages. If the input list is NULL, return latest versions for

ALL_STAGES.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_get_metric_history

Get Metric History

Description

Get a list of all values for the specified metric for a given run.

```
mlflow_get_metric_history(metric_key, run_id = NULL, client = NULL)
```

Arguments

metric_key Name of the metric.

run_id Run ID.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_get_model_version

Get a model version

Description

Get a model version

Usage

```
mlflow_get_model_version(name, version, client = NULL)
```

Arguments

name Name of the registered model.

version Model version number.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_get_registered_model

Get a registered model

Description

Retrieves a registered model from the Model Registry.

```
mlflow_get_registered_model(name, client = NULL)
```

mlflow_get_run 13

Arguments

name The name of the model to retrieve.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_get_run Get Run

Description

Gets metadata, params, tags, and metrics for a run. Returns a single value for each metric key: the most recently logged metric value at the largest step.

Usage

```
mlflow_get_run(run_id = NULL, client = NULL)
```

Arguments

run_id Run ID.

client (Optional) An MLflow client object returned from mlflow client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_get_tracking_uri

Get Remote Tracking URI

Description

Gets the remote tracking URI.

```
mlflow_get_tracking_uri()
```

14 mlflow_list_artifacts

mlflow_id

Get Run or Experiment ID

Description

Extracts the ID of the run or experiment.

Usage

```
mlflow_id(object)
## S3 method for class 'mlflow_run'
mlflow_id(object)
## S3 method for class 'mlflow_experiment'
mlflow_id(object)
```

Arguments

object

An 'mlflow_run' or 'mlflow_experiment' object.

Description

Gets a list of artifacts.

Usage

```
mlflow_list_artifacts(path = NULL, run_id = NULL, client = NULL)
```

Arguments

path The run's relative artifact path to list from. If not specified, it is set to the root

artifact path

run_id Run ID.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

mlflow_load_flavor 15

|--|

Description

Loads an MLflow model using a specific flavor. This method is called internally by mlflow_load_model, but is exposed for package authors to extend the supported MLflow models. See https://mlflow.org/docs/latest/models.html#st format for more info on MLflow model flavors.

Usage

```
mlflow_load_flavor(flavor, model_path)
```

Arguments

flavor An MLflow flavor object loaded by mlflow_load_model, with class loaded from

the flavor field in an MLmodel file.

model_path The path to the MLflow model wrapped in the correct class.

Description

Loads an MLflow model. MLflow models can have multiple model flavors. Not all flavors / models can be loaded in R. This method by default searches for a flavor supported by R/MLflow.

Usage

```
mlflow_load_model(model_uri, flavor = NULL, client = mlflow_client())
```

Arguments

flavor Optional flavor specification (string). Can be used to load a particular flavor in

case there are multiple flavors available.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

16 mlflow_log_artifact

Details

The URI scheme must be supported by MLflow - i.e. there has to be an MLflow artifact repository corresponding to the scheme of the URI. The content is expected to point to a directory containing MLmodel. The following are examples of valid model uris:

- "file:///absolute/path/to/local/model" "file:relative/path/to/local/model" "s3://my_bucket/path/to/model"
- "runs:/<mlflow_run_id>/run-relative/path/to/model" "models:/<model_name>/<model_version>"
- "models:/<model_name>/<stage>"

For more information about supported URI schemes, see the Artifacts Documentation at https://www.mlflow.org/docs/latest/trstores.

Description

Logs a specific file or directory as an artifact for a run.

Usage

```
mlflow_log_artifact(path, artifact_path = NULL, run_id = NULL, client = NULL)
```

Arguments

path The file or directory to log as an artifact.

artifact_path Destination path within the run's artifact URI.

run_id Run ID.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

Details

When logging to Amazon S3, ensure that you have the s3:PutObject, s3:GetObject, s3:ListBucket, and s3:GetBucketLocation permissions on your bucket.

Additionally, at least the AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY environment variables must be set to the corresponding key and secrets provided by Amazon IAM.

mlflow_log_batch 17

mlflow_log_batch	Log Batch
------------------	-----------

Description

Log a batch of metrics, params, and/or tags for a run. The server will respond with an error (non-200 status code) if any data failed to be persisted. In case of error (due to internal server error or an invalid request), partial data may be written.

Usage

```
mlflow_log_batch(
  metrics = NULL,
  params = NULL,
  tags = NULL,
  run_id = NULL,
  client = NULL
)
```

Arguments

metrics	A dataframe of metrics to log, containing the following columns: "key", "value", "step", "timestamp". This dataframe cannot contain any missing ('NA') entries.
params	A dataframe of params to log, containing the following columns: "key", "value". This dataframe cannot contain any missing ('NA') entries.
tags	A dataframe of tags to log, containing the following columns: "key", "value". This dataframe cannot contain any missing ('NA') entries.
run_id	Run ID.
client	(Optional) An MLflow client object returned from mlflow_client. If specified, MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated with the current tracking URI.

Description

Logs a metric for a run. Metrics key-value pair that records a single float measure. During a single execution of a run, a particular metric can be logged several times. The MLflow Backend keeps track of historical metric values along two axes: timestamp and step.

18 mlflow_log_model

Usage

```
mlflow_log_metric(
   key,
   value,
   timestamp = NULL,
   step = NULL,
   run_id = NULL,
   client = NULL
)
```

Arguments

key Name of the metric.

value Float value for the metric being logged.

timestamp at which to log the metric. Timestamp is rounded to the nearest

integer. If unspecified, the number of milliseconds since the Unix epoch is used.

step Step at which to log the metric. Step is rounded to the nearest integer. If unspec-

ified, the default value of zero is used.

run_id Run ID.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

Description

Logs a model for this run. Similar to 'mlflow_save_model()' but stores model as an artifact within the active run.

Usage

```
mlflow_log_model(model, artifact_path, ...)
```

Arguments

model The model that will perform a prediction.

artifact_path Destination path where this MLflow compatible model will be saved.

... Optional additional arguments passed to 'mlflow_save_model()' when persist-

ing the model. For example, 'conda_env = /path/to/conda.yaml' may be passed to specify a conda dependencies file for flavors (e.g. keras) that support conda

environments.

mlflow_log_param 19

mlflow_log_param	Log Parameter
------------------	---------------

Description

Logs a parameter for a run. Examples are params and hyperparams used for ML training, or constant dates and values used in an ETL pipeline. A param is a STRING key-value pair. For a run, a single parameter is allowed to be logged only once.

Usage

```
mlflow_log_param(key, value, run_id = NULL, client = NULL)
```

Arguments

key Name of the parameter.

value String value of the parameter.

run_id Run ID.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_param	Read Command-Line Parameter
IIII I IOW_par alli	Read Communa-Line Larameter

Description

Reads a command-line parameter passed to an MLflow project MLflow allows you to define named, typed input parameters to your R scripts via the mlflow_param API. This is useful for experimentation, e.g. tracking multiple invocations of the same script with different parameters.

Usage

```
mlflow_param(name, default = NULL, type = NULL, description = NULL)
```

Arguments

name The name of the parameter.

default The default value of the parameter.

type Type of this parameter. Required if 'default' is not set. If specified, must be one

of "numeric", "integer", or "string".

description Optional description for the parameter.

Examples

```
## Not run:
# This parametrized script trains a GBM model on the Iris dataset and can be run as an MLflow
# project. You can run this script (assuming it's saved at /some/directory/params_example.R)
# with custom parameters via:
# mlflow_run(entry_point = "params_example.R", uri = "/some/directory",
# parameters = list(num_trees = 200, learning_rate = 0.1))
install.packages("gbm")
library(mlflow)
library(gbm)
# define and read input parameters
num_trees <- mlflow_param(name = "num_trees", default = 200, type = "integer")
lr <- mlflow_param(name = "learning_rate", default = 0.1, type = "numeric")
# use params to fit a model
ir.adaboost <- gbm(Species ~., data=iris, n.trees=num_trees, shrinkage=lr)
## End(Not run)</pre>
```

mlflow_predict

Generate Prediction with MLflow Model

Description

Performs prediction over a model loaded using mlflow_load_model(), to be used by package authors to extend the supported MLflow models.

Usage

```
mlflow_predict(model, data, ...)
```

Arguments

model The loaded MLflow model flavor.

data A data frame to perform scoring.

... Optional additional arguments passed to underlying predict methods.

```
mlflow_register_external_observer
```

Register an external MLflow observer

Description

Registers an external MLflow observer that will receive a 'register_tracking_event(event_name, data)' callback on any model tracking event such as "create_run", "delete_run", or "log_metric". Each observer should have a 'register_tracking_event(event_name, data)' callback accepting a character vector 'event_name' specifying the name of the tracking event, and 'data' containing a list of attributes of the event. The callback should be non-blocking, and ideally should complete instantaneously. Any exception thrown from the callback will be ignored.

Usage

```
mlflow_register_external_observer(observer)
```

Arguments

observer

The observer object (see example)

Examples

```
library(mlflow)

observer <- structure(list())
observer$register_tracking_event <- function(event_name, data) {
  print(event_name)
  print(data)
}
mlflow_register_external_observer(observer)</pre>
```

```
mlflow_rename_experiment
```

Rename Experiment

Description

Renames an experiment.

Usage

```
mlflow_rename_experiment(new_name, experiment_id = NULL, client = NULL)
```

Arguments

new_name

The experiment's name will be changed to this. The new name must be unique.

experiment_id

ID of the associated experiment. This field is required.

client

(Optional) An MLflow client object returned from mlflow_client. If specified, MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated with the current tracking URI.

mlflow_rename_registered_model

Rename a registered model

Description

Renames a model in the Model Registry.

Usage

```
mlflow_rename_registered_model(name, new_name, client = NULL)
```

Arguments

name The current name of the model.

new_name The new name for the model.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_restore_experiment

Restore Experiment

Description

Restores an experiment marked for deletion. This also restores associated metadata, runs, metrics, and params. If experiment uses FileStore, underlying artifacts associated with experiment are also restored.

Usage

```
mlflow_restore_experiment(experiment_id, client = NULL)
```

Arguments

experiment_id ID of the associated experiment. This field is required.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

Details

Throws 'RESOURCE_DOES_NOT_EXIST' if the experiment was never created or was permanently deleted.

mlflow_restore_run 23

mlflow_restore_run

Restore a Run

Description

Restores the run with the specified ID.

Usage

```
mlflow_restore_run(run_id, client = NULL)
```

Arguments

run_id

Run ID.

client

(Optional) An MLflow client object returned from mlflow_client. If specified, MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated with the current tracking URI.

mlflow_rfunc_serve

Serve an RFunc MLflow Model

Description

Serves an RFunc MLflow model as a local REST API server. This interface provides similar functionality to "mlflow models serve" cli command, however, it can only be used to deploy models that include RFunc flavor. The deployed server supports standard mlflow models interface with /ping and /invocation endpoints. In addition, R function models also support deprecated /predict endpoint for generating predictions. The /predict endpoint will be removed in a future version of mlflow.

```
mlflow_rfunc_serve(
  model_uri,
  host = "127.0.0.1",
  port = 8090,
  daemonized = FALSE,
  browse = !daemonized,
  ...
)
```

24 mlflow_run

Arguments

model_uri The location, in URI format, of the MLflow model.

host Address to use to serve model, as a string.

Port to use to serve model, as numeric.

daemonized Makes 'httpuv' server daemonized so R interactive sessions are not blocked to

handle requests. To terminate a daemonized server, call 'httpuv::stopDaemonizedServer()'

with the handle returned from this call.

browse Launch browser with serving landing page?

. . . Optional arguments passed to 'mlflow_predict()'.

Details

The URI scheme must be supported by MLflow - i.e. there has to be an MLflow artifact repository corresponding to the scheme of the URI. The content is expected to point to a directory containing MLmodel. The following are examples of valid model uris:

- "file:///absolute/path/to/local/model" "file:relative/path/to/local/model" "s3://my_bucket/path/to/model"
- "runs:/<mlflow_run_id>/run-relative/path/to/model" "models:/<model_name>/<model_version>"
- "models:/<model_name>/<stage>"

For more information about supported URI schemes, see the Artifacts Documentation at https://www.mlflow.org/docs/latest/trstores.

Examples

```
## Not run:
library(mlflow)

# save simple model with constant prediction
mlflow_save_model(function(df) 1, "mlflow_constant")

# serve an existing model over a web interface
mlflow_rfunc_serve("mlflow_constant")

# request prediction from server
httr::POST("http://127.0.0.1:8090/predict/")

## End(Not run)
```

mlflow_run

Run an MLflow Project

Description

Wrapper for the 'mlflow run' CLI command. See https://www.mlflow.org/docs/latest/cli.html#mlflow-run for more info.

mlflow_run 25

Usage

```
mlflow_run(
   uri = ".",
   entry_point = NULL,
   version = NULL,
   parameters = NULL,
   experiment_id = NULL,
   experiment_name = NULL,
   backend = NULL,
   backend_config = NULL,
   env_manager = NULL,
   storage_dir = NULL
)
```

Arguments

uri A directory containing modeling scripts, defaults to the current directory.

entry_point Entry point within project, defaults to 'main' if not specified.

version Version of the project to run, as a Git commit reference for Git projects.

parameters A list of parameters.

experiment_id ID of the experiment under which to launch the run.

experiment_name

Name of the experiment under which to launch the run.

backend Execution backend to use for run.

backend_config Path to JSON file which will be passed to the backend. For the Databricks back-

end, it should describe the cluster to use when launching a run on Databricks.

env_manager If specified, create an environment for the project using the specified environ-

ment manager. Available options are 'local', 'virtualenv', and 'conda'.

storage_dir Valid only when 'backend' is local. MLflow downloads artifacts from dis-

tributed URIs passed to parameters of type 'path' to subdirectories of 'stor-

age_dir'.

Value

The run associated with this run.

Examples

```
## Not run:
# This parametrized script trains a GBM model on the Iris dataset and can be run as an MLflow
# project. You can run this script (assuming it's saved at /some/directory/params_example.R)
# with custom parameters via:
# mlflow_run(entry_point = "params_example.R", uri = "/some/directory",
# parameters = list(num_trees = 200, learning_rate = 0.1))
install.packages("gbm")
library(mlflow)
library(gbm)
```

```
# define and read input parameters
num_trees <- mlflow_param(name = "num_trees", default = 200, type = "integer")
lr <- mlflow_param(name = "learning_rate", default = 0.1, type = "numeric")
# use params to fit a model
ir.adaboost <- gbm(Species ~., data=iris, n.trees=num_trees, shrinkage=lr)
## End(Not run)</pre>
```

```
mlflow_save_model.crate
```

Save Model for MLflow

Description

Saves model in MLflow format that can later be used for prediction and serving. This method is generic to allow package authors to save custom model types.

Usage

```
## S3 method for class 'crate'
mlflow_save_model(model, path, model_spec = list(), ...)

mlflow_save_model(model, path, model_spec = list(), ...)

## S3 method for class 'H2OModel'
mlflow_save_model(model, path, model_spec = list(), conda_env = NULL, ...)

## S3 method for class 'keras.engine.training.Model'
mlflow_save_model(model, path, model_spec = list(), conda_env = NULL, ...)

## S3 method for class 'xgb.Booster'
mlflow_save_model(model, path, model_spec = list(), conda_env = NULL, ...)
```

Arguments

model The model that will perform a prediction.

path Destination path where this MLflow compatible model will be saved.

model_spec MLflow model config this model flavor is being added to.

Optional additional arguments.

conda_env Path to Conda dependencies file.

```
mlflow_search_experiments

Search Experiments
```

Description

Search for experiments that satisfy specified criteria.

Usage

```
mlflow_search_experiments(
  filter = NULL,
  experiment_view_type = c("ACTIVE_ONLY", "DELETED_ONLY", "ALL"),
  max_results = 1000,
  order_by = list(),
  page_token = NULL,
  client = NULL
)
```

Arguments

filter A filter expression used to identify specific experiments. The syntax is a sub-

set of SQL which allows only ANDing together binary operations. Examples: "attribute.name = 'MyExperiment'", "tags.problem_type = 'iris_regression'"

experiment_view_type

Experiment view type. Only experiments matching this view type are returned.

max_results Maximum number of experiments to retrieve.

order_by List of properties to order by. Example: "attribute.name".

page_token Pagination token to go to the next page based on a previous query.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

```
mlflow_search_registered_models

List registered models
```

Description

Retrieves a list of registered models.

28 mlflow_search_runs

Usage

```
mlflow_search_registered_models(
  filter = NULL,
  max_results = 100,
  order_by = list(),
  page_token = NULL,
  client = NULL
)
```

Arguments

client

filter A filter expression used to identify specific registered models. The syntax is a

subset of SQL which allows only ANDing together binary operations. Example:

"name = 'my_model_name' and tag.key = 'value1'"

max_results Maximum number of registered models to retrieve.

order_by List of registered model properties to order by. Example: "name".

page_token Pagination token to go to the next page based on a previous query.

(Optional) An MLflow client object returned from mlflow_client. If specified, MLflow will use the tracking server associated with the passed-in client. If

unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_search_runs Search Runs

Description

Search for runs that satisfy expressions. Search expressions can use Metric and Param keys.

Usage

```
mlflow_search_runs(
  filter = NULL,
  run_view_type = c("ACTIVE_ONLY", "DELETED_ONLY", "ALL"),
  experiment_ids = NULL,
  order_by = list(),
  client = NULL
)
```

Arguments

filter A filter expression over params, metrics, and tags, allowing returning a subset of

runs. The syntax is a subset of SQL which allows only ANDing together binary

operations between a param/metric/tag and a constant.

run_view_type Run view type.

mlflow_server 29

experiment_ids List of string experiment IDs (or a single string experiment ID) to search over.

Attempts to use active experiment if not specified.

order_by List of properties to order by. Example: "metrics.acc DESC".

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_server

Run MLflow Tracking Server

Description

Wrapper for 'mlflow server'.

Usage

```
mlflow_server(
   file_store = "mlruns",
   default_artifact_root = NULL,
   host = "127.0.0.1",
   port = 5000,
   workers = NULL,
   static_prefix = NULL,
   serve_artifacts = FALSE
)
```

Arguments

file_store The root of the backing file store for experiment and run data.

default_artifact_root

Local or S3 URI to store artifacts in, for newly created experiments.

host The network address to listen on (default: 127.0.0.1).

port The port to listen on (default: 5000).

workers Number of gunicorn worker processes to handle requests (default: 4).

static_prefix A prefix which will be prepended to the path of all static paths.

serve_artifacts

A flag specifying whether or not to enable artifact serving (default: FALSE).

```
mlflow_set_experiment Set Experiment
```

Description

Sets an experiment as the active experiment. Either the name or ID of the experiment can be provided. If the a name is provided but the experiment does not exist, this function creates an experiment with provided name. Returns the ID of the active experiment.

Usage

```
mlflow_set_experiment(
   experiment_name = NULL,
   experiment_id = NULL,
   artifact_location = NULL)
```

Arguments

```
experiment_name
```

Name of experiment to be activated.

experiment_id ID of experiment to be activated.

artifact_location

Location where all artifacts for this experiment are stored. If not provided, the remote server will select an appropriate default.

Description

Sets a tag on an experiment with the specified ID. Tags are experiment metadata that can be updated.

Usage

```
mlflow_set_experiment_tag(key, value, experiment_id = NULL, client = NULL)
```

Arguments

key Name of the tag. All storage backends are guaranteed to support key values up

to 250 bytes in size. This field is required.

value String value of the tag being logged. All storage backends are guaranteed to

support key values up to 5000 bytes in size. This field is required.

```
experiment_id ID of the experiment.
```

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

Description

Set a tag for the model version. When stage is set, tag will be set for latest model version of the stage. Setting both version and stage parameter will result in error.

Usage

```
mlflow_set_model_version_tag(
  name,
  version = NULL,
  key = NULL,
  value = NULL,
  stage = NULL,
  client = NULL
)
```

Arguments

name Registered model name.

version Registered model version.

key Tag key to log. key is required.

value Tag value to log. value is required.

stage Registered model stage.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

mlflow_set_tag

Set Tag

Description

Sets a tag on a run. Tags are run metadata that can be updated during a run and after a run completes.

Usage

```
mlflow_set_tag(key, value, run_id = NULL, client = NULL)
```

Arguments

key Name of the tag. Maximum size is 255 bytes. This field is required.

value String value of the tag being logged. Maximum size is 500 bytes. This field is

required.

run_id Run ID.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

mlflow_set_tracking_uri

Set Remote Tracking URI

Description

Specifies the URI to the remote MLflow server that will be used to track experiments.

Usage

```
mlflow_set_tracking_uri(uri)
```

Arguments

uri

The URI to the remote MLflow server.

mlflow_start_run 33

mlflow_start_run

Start Run

Description

Starts a new run. If 'client' is not provided, this function infers contextual information such as source name and version, and also registers the created run as the active run. If 'client' is provided, no inference is done, and additional arguments such as 'start_time' can be provided.

Usage

```
mlflow_start_run(
  run_id = NULL,
  experiment_id = NULL,
  start_time = NULL,
  tags = NULL,
  client = NULL,
  nested = FALSE
)
```

Arguments

run_id	If specified, get the run with the specified UUID and log metrics and params under that run. The run's end time is unset and its status is set to running, but the run's other attributes remain unchanged.
experiment_id	Used only when 'run_id' is unspecified. ID of the experiment under which to create the current run. If unspecified, the run is created under a new experiment with a randomly generated name.
start_time	Unix timestamp of when the run started in milliseconds. Only used when 'client' is specified.
tags	Additional metadata for run in key-value pairs. Only used when 'client' is specified.
client	(Optional) An MLflow client object returned from mlflow_client. If specified, MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated with the current tracking URI.
nested	Controls whether the run to be started is nested in a parent run. 'TRUE' creates a nest run.

Examples

```
## Not run:
with(mlflow_start_run(), {
    mlflow_log_metric("test", 10)
})
```

mlflow_ui

```
## End(Not run)
```

```
{\it mlflow\_transition\_model\_version\_stage} \\ {\it Transition\ ModelVersion\ Stage}
```

Description

Transition a model version to a different stage.

Usage

```
mlflow_transition_model_version_stage(
  name,
  version,
  stage,
  archive_existing_versions = FALSE,
  client = NULL
)
```

Arguments

name Name of the registered model.

version Model version number.

stage Transition 'model_version' to this stage.

 ${\tt archive_existing_versions}$

(Optional)

client

(Optional) An MLflow client object returned from mlflow_client. If specified, MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated with the current tracking URI.

mlflow_ui

Run MLflow User Interface

Description

Launches the MLflow user interface.

```
mlflow_ui(client, ...)
```

Arguments

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

with the current tracking URI.

... Optional arguments passed to 'mlflow_server()' when 'x' is a path to a file store.

Examples

```
## Not run:
library(mlflow)

# launch mlflow ui locally
mlflow_ui()

# launch mlflow ui for existing mlflow server
mlflow_set_tracking_uri("http://tracking-server:5000")
mlflow_ui()

## End(Not run)
```

mlflow_update_model_version

Update model version

Description

Updates a model version

Usage

```
mlflow_update_model_version(name, version, description, client = NULL)
```

Arguments

name Name of the registered model.

version Model version number.

description Description of this model version.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated

 ${\it mlflow_update_registered_model} \\ {\it Update\ a\ registered\ model}$

Description

Updates a model in the Model Registry.

Usage

mlflow_update_registered_model(name, description, client = NULL)

Arguments

name The name of the registered model.

description The updated description for this registered model.

client (Optional) An MLflow client object returned from mlflow_client. If specified,

MLflow will use the tracking server associated with the passed-in client. If unspecified (the common case), MLflow will use the tracking server associated
