

# Package ‘tongfen’

July 23, 2021

**Type** Package

**Title** Make Data Based on Different Geographies Comparable

**Version** 0.3.3

**Description** Several functions to allow comparisons of data across different geographies, in particular for Canadian census data from different censuses.

**License** MIT + file LICENSE

**Encoding** UTF-8

**ByteCompile** yes

**LazyData** true

**NeedsCompilation** no

**Imports** dplyr (>= 1.0),  
tidyr (>= 1.0),  
PROJ,  
sf,  
tibble,  
rlang,  
purrr,  
stringr,  
readr,  
utils,  
lifecycle

**RoxygenNote** 7.1.1

**Suggests** knitr,  
rmarkdown,  
RColorBrewer,  
ggplot2,  
geojsonsf,  
cancensus,  
tidycensus,  
spelling,  
readxl,  
scales

**VignetteBuilder** knitr

**URL** <https://github.com/mountainMath/tongfen>, <https://mountainmath.github.io/tongfen/>

**BugReports** <https://github.com/mountainMath/tongfen/issues>

**Language** en-US

**RdMacros** lifecycle

**Depends** R (>= 2.10)

**Index** **22**

---

add\_census\_ca\_base\_variables

*Generate metadata from Candian census vectors*

---

### Description

**[Maturing]**

Add Population, Dwellings, and Household counts to metadata

### Usage

```
add_census_ca_base_variables(meta)
```

### Arguments

meta                      ribble with metadata as for example provided by ‘meta\_for\_ca\_census\_vectors’

**Value**

tibble with metadata

---

aggregate\_data\_with\_meta

*Aggregate variables in grouped data*

---

**Description****[Maturing]**

Aggregate census data up, assumes data is grouped for aggregation Uses data from meta to determine how to aggregate up

**Usage**

```
aggregate_data_with_meta(data, meta, geo = FALSE, na.rm = TRUE, quiet = FALSE)
```

**Arguments**

data	census data as obtained from get_census call, grouped by TongfenID
meta	list with variables and aggregation information as obtained from meta_for_vectors
geo	logical, should also aggregate geographic data
na.rm	logical, should NA values be ignored or carried through.
quiet	logical, don't emit messages if set to 'TRUE'

**Value**

data frame with variables aggregated to new common geography

**Examples**

```
# Aggregate population from DA level to grouped by CT_UID
## Not run:
geo <- cancensus::get_census("CA06",regions=list(CSD="5915022"),level='DA')
meta <- meta_for_additive_variables("CA06","Population")
result <- aggregate_data_with_meta(geo %>% group_by(CT_UID),meta)

## End(Not run)
```

---

check\_tongfen\_areas    *Check geographic integrity*

---

## Description

### [Maturing]

Sanity check for areas of estimated tongfen correspondence. This is useful if for example the total extent of geo1 and geo2 differ and there are regions at the edges with large difference in overlap.

## Usage

```
check_tongfen_areas(data, correspondence)
```

## Arguments

**data**                    alist of geographic data of class sf

**correspondence**    Correspondence table with columns the unique geographic identifiers for each of the geographies and the TongfenID (and optionally TongfenUID and TongfenMethod) returned by 'estimate\_tongfen\_correspondence'.

## Value

A table with columns 'TongfenID', geo\_identifiers, the areas of the aggregated regions corresponding to each geographic identifier column, the tongfen estimation method and the maximum log ratio of the areas.

## Examples

```
# Estimate a common geography for 2006 and 2016 dissemination areas in the City of Vancouver
# based on the geographic data and check estimation errors
## Not run:
regions <- list(CSD="5915022")

data_06 <- censensus::get_census("CA06",regions=regions,geo_format='sf',level="DA") %>%
  rename(GeoUID_06=GeoUID)
data_16 <- censensus::get_census("CA16",regions=regions,geo_format="sf",level="DA") %>%
  rename(GeoUID_16=GeoUID)

correspondence <- estimate_tongfen_correspondence(list(data_06, data_16),
                                                  c("GeoUID_06", "GeoUID_16"))

area_check <- check_tongfen_areas(list(data_06, data_16),correspondence)

## End(Not run)
```

---

`check_tongfen_single_areas`*Check geographic integrity*

---

### Description

#### [Deprecated]

Sanity check for areas of estimated tongfen correspondence. This is useful if for example the total extent of geo1 and geo2 differ and there are regions at the edges with large difference in overlap.

### Usage

```
check_tongfen_single_areas(geo1, geo2, correspondence)
```

### Arguments

geo1	input geometry 1 of class sf
geo2	input geometry 2 of class sf
correspondence	Correspondence table between 'geo1' and 'geo2' as e.g. returned by 'estimate_tongfen_correspondence'.

### Value

A table with columns 'TongfenID', 'area1' and 'area2', where each row corresponds to a unique 'TongfenID' from them 'correspondence' table and the other columns hold the areas of the regions aggregated from 'geo1' and 'geo2'.

---

`estimate_tongfen_correspondence`*Generate tongfen correspondence for list of geographies*

---

### Description

#### [Maturing]

Get correspondence data for arbitrary congruent geometries. Congruent means that one can obtain a common tiling by aggregating several sub-geometries in each of the two input geo data. Worst case scenario the only common tiling is given by unioning all sub-geometries and there is no finer common tiling.

### Usage

```
estimate_tongfen_correspondence(  
  data,  
  geo_identifiers,  
  method = "estimate",  
  tolerance = 50,  
  computation_crs = NULL  
)
```

**Arguments**

data	list of geometries of class sf
geo_identifiers	vector of unique geographic identifiers for each list entry in data.
method	aggregation method. Possible values are "estimate" or "identifier". "estimate" estimates the correspondence purely from the geographic data. "identifier" assumes that regions with identical geo_identifiers are the same, and uses the "estimate" method for the remaining regions. Default is "estimate".
tolerance	tolerance (in projected coordinate units of 'computation_crs') for feature matching
computation_crs	optional crs in which the computation should be carried out, defaults to crs of the first entry in the data parameter.

**Value**

A correspondence table linking geo1\_uid and geo2\_uid with unique TongfenID and TongfenUID columns that enumerate the common geometry.

**Examples**

```
# Estimate a common geography for 2006 and 2016 dissemination areas in the City of Vancouver
# based on the geographic data.
## Not run:
regions <- list(CSD="5915022")

data_06 <- cancensus::get_census("CA06",regions=regions,geo_format='sf',level="DA") %>%
  rename(GeoUID_06=GeoUID)
data_16 <- cancensus::get_census("CA16",regions=regions,geo_format="sf",level="DA") %>%
  rename(GeoUID_16=GeoUID)

correspondence <- estimate_tongfen_correspondence(list(data_06, data_16),
  c("GeoUID_06", "GeoUID_16"))

## End(Not run)
```

---

```
estimate_tongfen_single_correspondence
```

*Generate togfen correspondence for two geographies*

---

**Description****[Maturing]**

Get correspondence data for arbitrary congruent geometries. Congruent means that one can obtain a common tiling by aggregating several sub-geometries in each of the two input geo data. Worst case scenario the only common tiling is given by unioning all sub-geometries and there is no finer common tiling.

**Usage**

```
estimate_tongfen_single_correspondence(
  geo1,
  geo2,
  geo1_uid,
  geo2_uid,
  tolerance = 1,
  computation_crs = NULL,
  robust = FALSE
)
```

**Arguments**

geo1	input geometry 1 of class sf
geo2	input geometry 2 of class sf
geo1_uid	(unique) identifier column for geo1
geo2_uid	(unique) identifier column for geo2
tolerance	tolerance (in projected coordinate units) for feature matching
computation_crs	optional crs in which the computation should be carried out, defaults to crs of geo1
robust	boolean parameter, will ensure geometries are valid if set to TRUE

**Value**

A correspondence table linking geo1\_uid and geo2\_uid with unique TongfenID and TongfenUID columns that enumerate the common geometry.

---

get\_correspondence\_ca\_census\_for

*Get StatCan DA or DB level correspondence file*

---

**Description**

**[Deprecated]** Joins the StatCan correspondence files for several census years

**Usage**

```
get_correspondence_ca_census_for(years, level, refresh = FALSE)
```

**Arguments**

years	list of census years
level	geographic level, DA or DB
refresh	reload the correspondence files, default is 'FALSE'

**Value**

tibble with correspondence table spanning all years

---

```
get_single_correspondence_ca_census_for
  Get StatCan DA or DB level correspondence file
```

---

**Description****[Maturing]****Usage**

```
get_single_correspondence_ca_census_for(
  year,
  level = c("DA", "DB"),
  refresh = FALSE
)
```

**Arguments**

year	census year
level	geographic level, DA or DB
refresh	reload the correspondence files, default is 'FALSE'

**Value**

tibble with correspondence table'

---

```
get_tongfen_ca_census Togfen data from several Canadian censuses
```

---

**Description****[Maturing]**

Get data from several Candian censuses on a common geography. Requires sf and cencensus package to be available

**Usage**

```
get_tongfen_ca_census(
  regions,
  meta,
  level = "CT",
  method = "statcan",
  base_geo = NULL,
  na.rm = FALSE,
  tolerance = 50,
  area_mismatch_cutoff = 0.1,
  quiet = FALSE,
  refresh = FALSE,
  crs = NULL,
  data_transform = function(d) d
)
```

**Arguments**

regions	census region list, should be inclusive list of GeoUIDs across censuses
meta	metadata for the census variables to aggregate, for example as returned by meta_for_ca_census_vectors.
level	aggregation level to return data on (default is "CT")
method	tongfen method, options are "statcan" (the default), "estimate", "identifier". * "statcan" method builds up the common geography using Statistics Canada correspondence files, at this point this method only works for "DB", "DA" and "CT" levels. * "estimate" uses 'estimate_tongfen_correspondence' to build up the common geography from scratch based on geographies. * "identifier" assumes regions with identical geographic identifier are identical, and builds up the the correspondence for regions with unmatched geographic identifiers.
base_geo	base census year to build up common geography from, 'NULL' (the default) to not return any geographi data
na.rm	logical, determines how NA values should be treated when aggregating variables
tolerance	tolerance for 'estimate_tongen_correspondence' in metres, default value is 50 metres, only used when method is 'estimate' or 'identifier'
area_mismatch_cutoff	discard areas returned by 'estimate_tongfen_correspondence' with area mismatch (log ratio) greater than cutoff, only used when method is 'estimate' or 'identifier'
quiet	suppress download progress output, default is 'FALSE'
refresh	optional character, refresh data cache for this call, (default 'FALSE')
crs	optional CRS to transform data to, and use for spatial intersections if method is 'identifier' or 'estimate'
data_transform	optional transform function to be applied to census data after being returned from cancensus

**Value**

dataframe with variables on common geography

**Examples**

```
# Get rent data for census years 2001 through 2016
## Not run:
rent_variables <- c(rent_2001="v_CA01_1667",rent_2016="v_CA16_4901",
                  rent_2011="v_CA11N_2292",rent_2006="v_CA06_2050")
meta <- meta_for_ca_census_vectors(rent_variables)

regions=list(CMA="59933")
rent_data <- get_tongfen_ca_census(regions=regions, meta=meta, quiet=TRUE,
                                 method="estimate", level="CT", base_geo = "CA16")

## End(Not run)
```

---

```
get_tongfen_ca_census_ct_from_da
```

*Canadian census CT level tongfen via DA correspondence*

---

## Description

### [Deprecated]

Grab variables from several censuses on a common geography. Requires sf package to be available  
Will return CT level data

## Usage

```
get_tongfen_ca_census_ct_from_da(
  regions,
  vectors,
  geo_format = NA,
  use_cache = TRUE,
  na.rm = TRUE,
  quiet = TRUE
)
```

## Arguments

regions	census region list, should be inclusive list of GeoUIDs across censuses
vectors	List of censuses vectors, can come from different census years
geo_format	'NA' to only get the variables or 'sf' to also get geographic data
use_cache	logical, passed to 'census::get_census' to regulate caching
na.rm	logical, determines how NA values should be treated when aggregating variables
quiet	suppress download progress output, default is 'TRUE'

## Value

dataframe with variables on common geography

---

```
get_tongfen_census_ct Canadian census CT level tongfen
```

---

## Description

### [Deprecated]

Grab variables from several censuses on a common geography. Requires sf package to be available  
Will return CT level data

**Usage**

```
get_tongfen_census_ct(
  regions,
  vectors,
  geo_format = NA,
  na.rm = TRUE,
  quiet = TRUE,
  refresh = FALSE
)
```

**Arguments**

regions	census region list, should be inclusive list of GeoUIDs across censuses
vectors	List of census vectors, can come from different census years
geo_format	geographic format for returned data, 'sf' for sf format and 'NA'
na.rm	remove NA values when aggregating up values, default is 'TRUE'
quiet	suppress download progress output, default is 'FALSE'
refresh	optional character, refresh data cache for this call

**Value**

dataframe with census variables on common geography

---

get\_tongfen\_census\_da *Canadian Census DA level tongfen*

---

**Description****[Deprecated]**

Grab variables from several censuses on a common geography. Requires sf package to be available  
Will return CT level data

**Usage**

```
get_tongfen_census_da(
  regions,
  vectors,
  geo_format = NA,
  use_cache = TRUE,
  na.rm = TRUE,
  quiet = TRUE
)
```

**Arguments**

regions	census region list, should be inclusive list of GeoUIDs across censuses
vectors	List of census vectors, can come from different census years
geo_format	'NA' to only get the variables or 'sf' to also get geographic data
use_cache	logical, passed to 'census::get_census' to regulate caching
na.rm	logical, determines how NA values should be treated when aggregating variables
quiet	suppress download progress output, default is 'TRUE'

**Value**

dataframe with variables on common geography

---

```
get_tongfen_correspondence_ca_census
  Get StatCan correspondence data
```

---

**Description****[Maturing]**

Get correspondence file for several Candian censuses on a common geography. Requires sf and cancensus package to be available

**Usage**

```
get_tongfen_correspondence_ca_census(
  geo_datasets,
  regions,
  level = "CT",
  method = "statcan",
  tolerance = 50,
  area_mismatch_cutoff = 0.1,
  quiet = FALSE,
  refresh = FALSE
)
```

**Arguments**

geo_datasets	vector of census geography dataset identifiers
regions	census region list, should be inclusive list of GeoUIDs across censuses
level	aggregation level to return data on (default is "CT")
method	tongfen method, options are "statcan" (the default), "estimate", "identifier". * "statcan" method builds up the common geography using Statistics Canada correspondence files, at this point this method only works for "DB", "DA" and "CT" levels. * "estimate" uses 'estimate_tongfen_correspondence' to build up the common geography from scratch based on geographies. * "identifier" assumes regions with identical geographic identifier are identical, and builds up the the correspondence for regions with unmatched geographic identifiers.
tolerance	tolerance for 'estimate_tongen_correspondence' in metres, default value is 50 metres.
area_mismatch_cutoff	discard areas returned by 'estimate_tongfen_correspondence' with area mismatch (log ratio) greater than cutoff.
quiet	suppress download progress output, default is 'FALSE'
refresh	optional character, refresh data cache for this call, (default 'FALSE')

**Value**

dataframe with the multi-census correspondence file

**Examples**

```
# Get correspondance files between CTs in 2006 and 2016 censuses in Vancouver CMA
## Not run:
correspondence <- get_tongfen_correspondence_ca_census(geo_datasets=c('CA06', 'CA16'),
                                                    regions=list(CMA="59933"), level='CT')

## End(Not run)
```

---

get\_tongfen\_us\_census *Get US census data for 2000 and 2010 census on common census tract based geography*

---

**Description****[Maturing]**

This wraps data acquisition via the tidycensus package and tongfen on a common geography into a single convenience function.

**Usage**

```
get_tongfen_us_census(
  regions,
  meta,
  level = "tract",
  survey = "census",
  base_geo = NULL
)
```

**Arguments**

regions	list with regions to query the data for. At this stage, the only valid list is a vector of states, i.e. 'regions = list(state=c("CA", "OR"))'
meta	metadata for variables to retrieve
level	aggregation level to return the data on. At this stage, the only valid levels are 'tract' and 'county subdivision'.
survey	survey to get data for, supported options is "census"
base_geo	census year to use as base geography, default is '2010'.

**Value**

sf object with (wide form) census variables with census year as suffix (separated by undercore "\_").

**Examples**

```
# Get US census data on population and households for 2000 and 2010 censuses on a uniform geography
# based on census tracts.
## Not run:
variables=c(population="H011001", households="H013001")
```

```

meta <- c(2000,2010) %>%
  lapply(function(year){
    v <- variables %>% setNames(paste0(names(.),"_",year))
    meta_for_additive_variables(paste0("dec",year),v)
  }) %>%
  bind_rows()
census_data <- get_tongfen_us_census(regions = list(state="CA"), meta=meta, level="tract") %>%
  mutate(change=population_2010/households_2010-population_2000/households_2000)

## End(Not run)

```

---

```
meta_for_additive_variables
```

*Generate tongfen metadata for additive variables*

---

## Description

### [Maturing]

Generates metadata to be used in tongfen\_aggregate. Variables need to be additive like counts.

## Usage

```
meta_for_additive_variables(dataset, variables)
```

## Arguments

dataset	identifier for the dataset containing the variable
variables	(named) vector with additive variables

## Value

a tibble to be used in tongfen\_aggregate

## Examples

```

# Get metadata for additive variable Population for the CA16 and CA06 datasets
## Not run:
meta <- meta_for_additive_variables(c("CA06","CA16"),"Population")

## End(Not run)

```

---

`meta_for_ca_census_vectors`*Generate metadata from Candian census vectors*

---

## Description

### [Maturing]

Build tibble with information on how to aggregate variables given vectors Queries list\_census\_variables to obtain needed information and add in vectors needed for aggregation

## Usage

```
meta_for_ca_census_vectors(vectors)
```

## Arguments

vectors            list of variables to query

## Value

tidy dataframe with metadata information for requested variables and additional variables needed for tongfen operations

## Examples

```
# Build metadata for vectors
## Not run:
meta <- meta_for_ca_census_vectors("v_CA16_4836", "v_CA16_4838", "v_CA16_4899")

## End(Not run)
```

---

`proportional_reaggregate`*Dasymetric downsampling*

---

## Description

### [Maturing]

Proportionally re-aggregate hierarchical data to lower-level w.r.t. values of the \*base\* variable Also handles cases where lower level data may be available but blinded at times by filling in data from higher level

Data at lower aggregation levels may not add up to the more accurate aggregate counts. This function distributes the aggregate level counts proportionally (by population) to the containing lower level geographic regions.

**Usage**

```
proportional_reaggregate(
  data,
  parent_data,
  geo_match,
  categories,
  base = "Population"
)
```

**Arguments**

data	The base geographic data
parent_data	Higher level geographic data
geo_match	A named string informing on what column names to match data and parent_data
categories	Vector of column names to re-aggregate
base	Column name to use for proportional weighting when re-aggregating

**Value**

dataframe with downsampled variables from parent\_data

**Examples**

```
# Proportionally reaggregate visible minority data from dissemination area 2016
# census data to dissemination block geography, proportionally based on dissemination
# block population
## Not run:
regions <- list(CSD="5915022")
variables <- cancensus::child_census_vectors("v_CA16_3954")

da_data <- cancensus::get_census("CA16",regions=regions,
                                vectors=setNames(variables$vector,variables$label),
                                level="DA")
geo_data <- cancensus::get_census("CA16",regions=regions,geo_format="sf",level="DB")

db_data <- geo_data %>% proportional_reaggregate(da_data,c("DA_UID"="GeoUID"),variables$label)

## End(Not run)
```

---

tongfen_aggregate	<i>Perform tongfen according to correspondence</i>
-------------------	--

---

**Description****[Maturing]**

Aggregate variables specified in meta for several datasets according to correspondence.

**Usage**

```
tongfen_aggregate(data, correspondence, meta = NULL, base_geo = NULL)
```

**Arguments**

data	list of datasets to be aggregated
correspondence	correspondence data for gluing up the datasets
meta	metadata containing aggregation rules as for example returned by ‘meta_for_ca_census_vectors’
base_geo	identifier for which data element to base the final geography on, uses the first data element if ‘NULL’ (default), expects that ‘base_geo’ is an element of ‘names(data)’.

**Value**

aggregated dataset of class sf if base\_geo is not NULL and data is of type sf or tibble otherwise.

**Examples**

```
# aggregate census tract level 2006 population data on common geography build through
# correspondence from 2006 and 2016 census tracts in the City of Vancouver.
## Not run:
regions <- list(CSD="5915022")
geo1 <- cancensus::get_census("CA06",regions=regions,geo_format='sf',level='CT')
geo2 <- cancensus::get_census("CA16",regions=regions,geo_format='sf',level='CT')
meta <- meta_for_additive_variables("CA06","Population")
correspondence <- get_tongfen_correspondence_ca_census(geo_datasets=c('CA06','CA16'),
                                                    regions=regions,level='CT')
result <- tongfen_aggregate(list(geo1 %>% rename(GeoUIDCA06=GeoUID),
                                geo2 %>% rename(GeoUIDCA16=GeoUID)),correspondence,meta)

## End(Not run)
```

---

tongfen\_ca\_census\_ct *Canadian census CT level tongfen via identifier matching*

---

**Description****[Deprecated]**

Aggregate variables to common CTs, returns data2 on new tiling matching data1 geography

**Usage**

```
tongfen_ca_census_ct(
  data1,
  data2,
  data2_sum_vars,
  data2_group_vars = c(),
  na.rm = TRUE
)
```

**Arguments**

data1	cancensus CT level dataset for year1 < year2 to serve as base for common geography
data2	cancensus CT level dataset for year2 to be aggregated to common geography
data2_sum_vars	vector of variable names to be summed up when aggregating geographies
data2_group_vars	optional vector of grouping variables
na.rm	optional parameter to remove NA values when summing, default = 'TRUE'

---

tongfen_estimate	<i>Estimate variable values for custom geography</i>
------------------	--

---

**Description****[Maturing]**

Estimates data from source geometry onto target geometry

**Usage**

```
tongfen_estimate(target, source, meta, na.rm = FALSE)
```

**Arguments**

target	custom geography to estimate values for
source	input geography with values
meta	metadata for variable aggregation
na.rm	remove NA values when aggregating, default is FALSE

**Examples**

```
# Estimate 2006 Populatio in the City of Vancouver dissemination ares on 2016 census geographies
## Not run:
geo1 <- cancensus::get_census("CA06", regions=list(CSD="5915022"), geo_format='sf', level='DA')
geo2 <- cancensus::get_census("CA16", regions=list(CSD="5915022"), geo_format='sf', level='DA')
meta <- meta_for_additive_variables("CA06", "Population")
result <- tongfen_estimate(geo2 %>% rename(Population_2016=Population), geo1, meta)

## End(Not run)
```

---

 tongfen\_estimate\_ca\_census

*Tongfen estimate data for given geometry*

---

## Description

### [Maturing]

Estimates values for the given census vectors for the given geometry using data from the specified level range

## Usage

```
tongfen_estimate_ca_census(
  geometry,
  meta,
  level,
  intersection_level = level,
  downsample_level = NULL,
  na.rm = FALSE,
  quiet = FALSE
)
```

## Arguments

geometry	geometry
meta	metadata for the census variables to aggregate, for example as returned by ‘meta_for_ca_census_vectors’. At this point this function only accepts variables from the same census geography year. We will expand this to also allow estimates across multiple census geography years, but this requires further attention to detail. It is recommended to apply due caution when running this function separately across several census geography years with the purpose of comparing data across time as a naive application can lead to systematic biases.
level	level to use for tongfen
intersection_level	level to use for geometry intersection, if different from tongfen level by meta_for_ca_census_vectors. This can be set at a higher aggregation level to conserve API points for the ‘get_intersecting_geometries’ call.
downsample_level	default ‘NULL’, can be a geographic level lower than ‘level’, in which case the data is downsampled to that geography level proportionally using the value of the ‘downsample’ column (must be supplied) in the ‘meta’ argument before intersecting the geometries. This can lead to more accurate results. At this point the only allowed variables for the ‘downsample’ column in ‘meta’ are "Population", "Households" or "Dwellings", and it can only be one of these for all variables.
na.rm	how to deal with NA values, default is FALSE.
quiet	suppress progress messages

**Examples**

```
# Estimate a common geography for 2006 and 2016 dissemination areas in the City of Vancouver
# based on the geographic data and check estimation errors
## Not run:
toronto_city_hall <- sf::st_point(c(-79.3839,43.6534)) %>%
  sf::st_sfc(crs=4326) %>%
  sf::st_transform(3348) %>%
  sf::st_buffer(1000) %>%
  sf::st_sf()

meta <- meta_for_additive_variables("CA16", "Population")

data <- tongfen_estimate_ca_census(toronto_city_hall, meta, level="DA", intersection_level="CT")

print(paste0("Approximately ", scales::comma(data$Population, accuracy=100),
  " people live within a 1 km radius of Toronto City.))

## End(Not run)
```
